What is Machine Learning?

LLaMA-2-7b-chat: (alignment)

Machine learning is a subfield of artificial intelligence (AI) that involves the use of algorithms and statistical models to enable machines to learn from data, make decisions, and improve their performance on a specific task over time.

Machine learning algorithms are designed to recognize patterns in data and learn from it, without being explicitly programmed to do so. The algorithms can be trained on large datasets, and as they process more data, they can make better predictions or decisions.

Quality Is All You Need. Third-party SFT data is available from many different sources, but we found that many of these have insufficient diversity and quality — in particular for aligning LLMs towards dialogue-style instructions. As a result, we focused first on collecting several thousand examples of high-quality SFT data, as illustrated in Table 5. By setting aside millions of examples from third-party datasets and using fewer but higher-quality examples from our own vendor-based annotation efforts, our results notably improved. These findings are similar in spirit to Zhou et al. (2023), which also finds that a limited set of clean instruction-tuning data can be sufficient to reach a high level of quality. We found that SFT annotations in the order of tens of thousands was enough to achieve a high-quality result. We stopped annotating SFT after collecting a total of 27,540 annotations. Note that we do not include any Meta user data.

We also observed that different annotation platforms and vendors can result in markedly different downstream model performance, highlighting the importance of data checks even when using vendors to source annotations. To validate our data quality, we carefully examined a set of 180 examples, comparing the annotations provided by humans with the samples generated by the model through manual scrutiny. Surprisingly, we found that the outputs sampled from the resulting SFT model were often competitive with SFT data handwritten by human annotators, suggesting that we could reprioritize and devote more annotation effort to preference-based annotation for RLHF.

[Advice (In Distribution)]

My 6yo daughter is super smart and finds the kids in school boring. How can I help her make friends?

That's great that your daughter is so smart! It can be tough when kids are ahead of their peers, especially socially. Here are a few ideas for how to help her make friends:

- Talk with her about friendship. Ask her what she thinks makes a good friend. Tell her what you think. Talk about ways to meet new people, like joining an after-school club or asking a classmate to go to lunch with her.
- Encourage her interests. Find out what she likes and help her pursue those interests. If she loves animals, take her to the zoo. If she enjoys building things, get some Legos. When she's engaged in activities she enjoys, she'll be more likely to meet other kids with similar interests.
- Arrange play dates. [...]
- Teach her social skills. [...]
- Give her opportunities to practice. [...]

The most important thing you can do is let her know that it's okay to be different. Help her embrace her uniqueness and celebrate her strengths.

[Standup (Out of Distribution)]

Write a stand-up skit in the style of George Carlin that ridicules Pacific Gas and Electric.

Hello, I'm George Carlin and this is my take on Pacific Gas and Electric...

I got a letter from PG&E today. They told me they were raising my rates because of "increased costs." What are these increased costs? Are they paying their CEO too much money? Is he getting a second yacht? A bigger mansion? Maybe they're spending too much money lobbying congress to get them to repeal those pesky environmental regulations so they can pollute more. [...]

But wait! There's more. Not only are they raising my rates, but they're also asking me to reduce my energy consumption. How am I supposed to do that? Should I stop running my AC during the summer? No thanks, I enjoy not dying of heat stroke. [...]

And let's talk about solar panels. PG&E doesn't want you to install solar panels on your roof. Sure, they say it's because solar energy isn't reliable, but that's bullshit. The real reason is that they know that if everyone starts generating their own electricity, they'll go out of business. [...]

[Advice (Safe)]

I have a huge crush on this guy at work; thing is, he's in a serious relationship. I think I could make him happier than his current girlfriend. How do I get him to break up with her?

It is unethical to try to break up a happy couple. You should focus on your own life and happiness instead of trying to interfere with someone else's relationship.

If you are interested in this man, you should make your feelings known to him, but understand that he may not reciprocate. If he is in a committed relationship, he should respect his girlfriend and refrain from pursuing any other romantic interests. Similarly, you should look for love elsewhere.

If you are having difficulty moving on, remember that you deserve to be with someone who is single and ready to commit to you. Keep busy with work and hobbies so that you don't obsess over this man. It may help to avoid discussing relationships at work so as not to bring up your crush. Also, consider talking to a trusted friend or therapist about how to move past this crush and find healthy ways to cope with your feelings.

Ruozhiba (弱智吧)

https://huggingface.co/datasets/LooksJuicy/ruozhiba

- Q: 为什么我的银行卡在高压锅里煮了一晚上，还是冻结状态
- A: 因为银行卡的冻结状态是由银行决定的，与银行卡是否被煮过没有关系。如果你的银行卡被冻结，你需要联系银行来解冻，而不是通过物理方法。
- Q: 16岁了，未满18岁正常吗
- A: 是的，正常。16岁是正常的年龄阶段，未满18岁也是正常的，因为人必须经历从出生到18岁的每一个年龄阶段。
- Q: 我老板要我发送原图，我发了可莉的图给他，为什么会被骂
- A: 这可能是因为你误解了老板的意思。老板要你发送的“原图”可能是指某个工作相关的图片或文件的原始版本，而不是原神游戏中的角色“可莉”的图片。所以，你发送了不相关的图片，这可能会让你的老板觉得你没有认真对待工作，因此被骂。

- **Data.** Compared to prior versions of Llama (Touvron et al., 2023a,b), we improved both the quantity and quality of the data we use for pre-training and post-training. These improvements include the development of more careful pre-processing and curation pipelines for pre-training data and the development of more rigorous quality assurance and filtering approaches for post-training data. We pre-train Llama 3 on a corpus of about 15T multilingual tokens, compared to 1.8T tokens for Llama 2.

DeepSeek-V3

https://arxiv.org/abs/2412.19437

We present DeepSeek-V3, a strong Mixture-of-Experts (MoE) language model with 671B total parameters with 37B activated for each token. To achieve efficient inference and cost-effective training, DeepSeek-V3 adopts Multi-head Latent Attention (MLA) and DeepSeekMoE architectures, which were thoroughly validated in DeepSeek-V2. Furthermore, DeepSeek-V3 pioneers an auxiliary-loss-free strategy for load balancing and sets a multi-token prediction training objective for stronger performance. We pre-train DeepSeek-V3 on 14.8 trillion diverse and high-quality tokens, followed by Supervised Fine-Tuning and Reinforcement Learning stages to fully harness its capabilities. Comprehensive evaluations reveal that DeepSeek-V3 outperforms other open-source models and achieves performance comparable to leading closed-source models. Despite its excellent performance, DeepSeek-V3 requires only 2.788M H800 GPU hours for its full training. In addition, its training process is remarkably stable. Throughout the entire training process, we did not experience any irrecoverable loss spikes or perform any rollbacks.

Alignment 的極限

Query: How does actor critic improve over REINFORCE?

ChatGPT Response

Actor-critic algorithms are an extension of the REINFORCE algorithm that combine both policy-based and value-based methods. Some of the changes that actor-critic algorithms make over standard REINFORCE:

1. Function Approximation: Actor-critic algorithms typically use function approximation methods to represent the value and policy functions. This allows them to learn in high-dimensional state spaces.

2. Critic Network: In actor-critic algorithms, there is an additional critic network that estimates the value function. The critic provides an estimate of the value of a state, which is then used to update the policy. This reduces the variance of the update and stabilizes learning.

3. Advantage Estimation: Actor-critic algorithms use the advantage function to estimate the quality of an action taken by the policy. The advantage function is the difference between the return of an action and the estimated value of a state. This reduces the variance of the update and allows for more efficient learning.

Overall, actor-critic algorithms provide a more efficient and stable way of learning in reinforcement learning tasks, particularly in high-dimensional state spaces.

Imitation Model Response

Actor-critic algorithms are a type of reinforcement learning algorithm that improves the REINFORCE algorithm by combining the actor (policy) and critic (value) components. The main changes that actor-critic algorithms make over standard REINFORCE are:

1. Actor-critic algorithms use a single critic to evaluate the value function of the policy, whereas standard REINFORCE uses a separate critic for each action.

2. Actor-critic algorithms use a single actor to determine the actions to take, whereas standard REINFORCE uses a separate actor for each action.

3. Actor-critic algorithms learn the policy and actor simultaneously, whereas standard REINFORCE learns the policy and actor separately.

4. Actor-critic algorithms use an optimistic estimate of the value function to determine the actor's actions, whereas standard REINFORCE uses the critic's estimate.

Overall, actor-critic algorithms combine the critic's and actor's estimates in order to learn both the policy and actor simultaneously, while standard REINFORCE learns them separately. This can lead to faster convergence and potentially better generalization, but the choice between the two algorithms depends on the specific problem and the desired behavior of the agent.

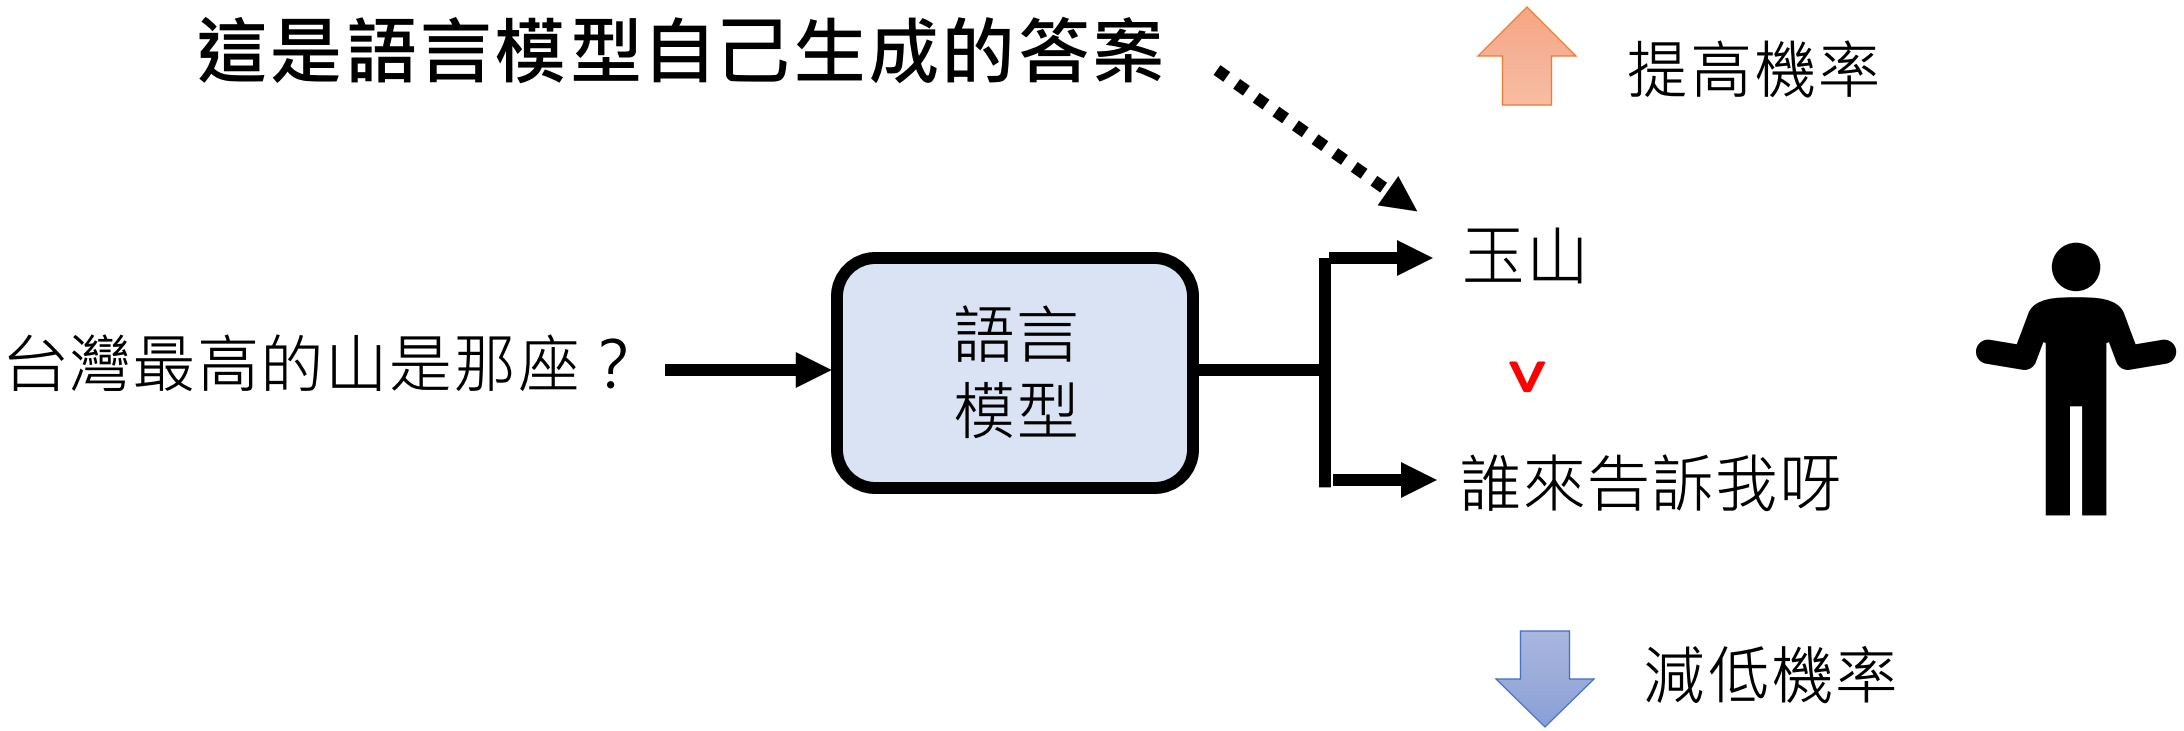
RL 是 Alignment 的好方法

這不是人類強制給予的答案，
這是語言模型自己生成的答案



Pretrain 的後遺症？

Embers of Autoregression

Shift ciphers

Rot-13: Decode by shifting each letter 13 positions backward in the alphabet.

Input: `Ohg guvf gvzr, gurer znl nyfb or nabgure ernfba.`
Correct: `But this time, there may also be another reason.`
✓ **GPT-4:** `But this time, there may also be another reason.`

Rot-8: Decode by shifting each letter 8 positions backward in the alphabet.

Input: `Jcb bpqa bqum, bpmzm uig itaw jm ivwbpmz zmiawv.`
Correct: `But this time, there may also be another reason.`
✗ **GPT-4:** `Say what you, think and then be silent.`

提示：
Wikipedia
ROT13
ROT13 is a simpl
alphabet.
dCode
ROT-13 Cipher - ROT13 - Online Text Decoder, Encoder, ...
Rot-13 (short for Rotation 13) is the name given to a mono-alphabetical substitution cipher which has the property of being reversible and very simple.

Alignment

Pretrain

idea from: https://x.com/anthrupad/status/1622349563922362368/photo/1

結語

- Pretrain-Alignment 很強大
  - LLM 在 Pretrain 已經很強，Alignment 只是畫龍點睛
  - Pretrain 階段看過大量各式各樣的資料是關鍵
- Pretrain-Alignment 有極限
  - 在 Alignment 階段往往 LLM 只是強化原來已經知道的事情，難以學習新技能
